NomiDio
Open ID

## Users can now login everywhere with passwordless biometric multi-factor authentication

Passwordless biometric authentication no longer needs to be highly expensive to acquire, deploy and manage. Served from the cloud, Nomidio OpenID lowers the cost of entry, offers a superior low-friction user experience and increases the security posture of both the user and the organisation.

We understand organisations have existing, often mature, IAM solutions. Nomidio simply replaces the Identity element and significantly enhances it. Based on the recognised standard, OpenID Connect, our solution enables you to easily provide multi-factor biometric authentication that is passwordless, securing your infrastructure and employees.

Biometrics have traditionally been the solution for larger organisations, with long and complex implementations, Nomidio is changing the norm. Nomidio OpenID can be deployed and live within an hour and is served on a pay per use basis, delivering user authentication at scale.

Use Case

Nomidio OpenID may be deployed for all employees, third parties or contractors and ensures that the person authenticating to your services is the person authorised to do so. Biometrics prevent credential sharing whilst phishing for the purpose of credential theft becomes pointless. Importantly, you now have a biometric audit trail you can depend on.
Across Applications

Whilst easily integrated into external vendors or supplier portals, Nomidio OpenID connects with large third party apps you already use, such as Salesforce and Zendesk.

Login From Anywhere

The service is consumed through a browser, rather than an app. No phone? No problem. As long as there is a microphone and a camera on the device you are good to go.

The High Challenge

The combination of multi-factor authentication and biometric security offers standard or high security challenges depending on access and authorisation requirements. For example, you can add an enhanced security challenge (voice and face) for managers if they need to override a deviation, or reach a threshold for approval.

Highlights

- Passwordless biometric multi-factor authentication – Nomidio OpenID provides a clean user experience to simplify identity in both the consumer and corporate worlds.

- Nomidio OpenID is browser based with no server footprint. This removes cost, complexity and risk when identifying individuals in the digital world.

- Nomidio OpenID is consumption based, easy to configure and quick to deploy.

- Open Standards enable Access Management systems to call on the Nomidio OpenID service for authentication and to add additional security challenges for high risk access / approvals.
